

VS500S

Premature, Neonatal & Pediatric Ventilator

Care the Future
Carry the Hope

Start respiratory care with VS500S

VS500S is a specially designed non-invasive ventilator for premature infant, neonate and pediatric. It provides comprehensive non-invasive ventilation to meet various respiratory management requirements.

10.4" highly sensitive capacitive touchscreen

Provides clear vision with comprehensive monitoring data.

Easy to learn, Easy to operate

- User-friendly interface
- No hidden menu
- Immediately access and change ventilation modes and parameters

4 types of ventilation mode fully cover various clinical needs

NCPAP appears to stabilize the chest wall and upper airway and to reduce apneas. Early application of CPAP might also preserve surfactant. [1]

RT staff. (2007)

SNIPPV can improve stability of chest wall and pulmonary mechanics. SNIPPV can be a means to wean infants from mechanical ventilation. [3], [4]

Santin et al. (2004)
Dumpa et al. (2012)

NIPPV is associated with a significantly decreased need for intubation including among the extremely preterm infants. [2]

Shi et al. (2020)

HFNC is to optimize spontaneous breathing through the reduction of dead space and the creation of positive distending airway pressure. [5]

Real-time monitoring assures patient safety

With SpO₂ module, VS500S has real-time monitoring including 3 waveforms, SpO₂/FiO₂, PI and OSI to give more reference for clinical decision to facilitate early diagnosis of Acute Lung Injury and Acute Respiratory Distress Syndrome.

- **Oxygen Saturation Index- (OSI) A noninvasive Tool for Monitoring Hypoxemic Respiratory Failure in Newborns**

OSI can be calculated readily and continuously at the bedside, without the need for invasive blood sampling, and may be useful in identifying infants with mild to moderate HRF and evaluating response to some interventions. [6]

Doreswamy et al. (2016)

- **SpO₂/FiO₂**

The SpO₂/FiO₂ is an independent indicator of ARDS development among patients at risk. [7]

Festic et al. (2015)

- **Perfusion index (PI)**

Perfusion index (PI) is normally monitored with pulse oximeters. It is a good indicator of the reliability of the pulse oximeter reading, and can be used as a non-invasive tool to predict illness severity and mortality in pediatric ICU and emergency departments. [8], [9]

Bazaraa et al. (2021)

- **Waveforms: Pressure-T, Flow-T, SpO₂-T**

Provide real-time information about patient-ventilator interaction and ventilator function. You can observe the change in a patient's condition from breath to breath, detect problems related to mechanical ventilation, evaluate the patient's response to interventions, and use this information to adjust therapy as needed. [10]

Lian, J. X. (2009)

According to the neonatal unique breathing pattern, abdominal respiratory sensor was adopted to prevent apnea and start apnea back up ventilation on time.

Intuitive & convenient clinical tools

Eazy to use
Einfach zu bedienen

Adopt advanced Intelligent Assistant Oxygen (IAO) technique

Intelligent Assistant Oxygen (IAO) automatically maintains the oxygen concentration within the target range, ensures patient safety with lesser workload.

- Ensure safety: Accurately and timely control the oxygenation to ensure patient safety.
- Decrease workload: Free the healthcare professionals from frequently adjusting the machine & help on improving work efficiency and quality of care.
